## PUMICE

*Powder, Sand, Granules*

Pumice is a natural aluminosilicate of volcanic origin with a sharp conchoidal fracture that makes it ideally suitable for use as a mild abrasive. It consists largely of silica and aluminium oxide.

Raw material is crushed and sorted into various different sizes, from large pebbles or stones down to very fine powder. As well as being used in cosmetics for exfoliation, different grades of pumice granules are also used in a variety of industrial applications. Larger pumice stones are used to remove excess skin from hardened areas such as the feet and much finer grades are sometimes used in toothpaste.

The pumice sold by A & E Connock is typically sourced from the volcanic regions of Europe or North America. In hardness terms, it falls near the middle of the *Mohs* scale with a value of around 5 to 6, which is similar to glass (Talc is 1 and Diamond is 10).
